Chapter 4 Cascading Style Sheet

1. Inline CSS (inside HTML tag)

Uses `style=""` **`attribute`** inside elements

Example 1

- `<h1 style="color: blue;">Hello</h1>`
- `<p style="color: red;">This is a paragraph</p>`
- `<p style="font-size: 20px;">Big text</p>`
- `<h2 style="background-color: yellow;">Title</h2>`
- `<p style="color: green; text-align: center;">Centered text</p>`

2. Embedded CSS (inside <style> tag in head section)

Applies to whole page

Example 1

```
<style>
      p { color: blue; }

      h1 { color: red; }

      body { background-color: lightgray; }

      h2 { text-align: center; }

      p { font-size: 18px; }
</style>
```

3. External CSS (separate .css file)

CSS in another file, linked with `<link>`

```
Create file name it for example (style.css)
```

Example CSS file (style.css)

```
p { color: blue; }
```

```
h1 { color: red; }
body { background-color: black; }
p { font-size: 20px; }
h2 { text-align: center; }
ul { color: green; }
```

HTML file

```
<link rel="stylesheet" href="style.css">
```

Bonus (from your chapter)

Imported CSS (extra type)

```
@import url("style.css");
```
